NOTE: This is an open book, open notes exam.

1. Consider a material manufacturing process, where a thin film is deposited on top of a substrate, as shown in the figure below. The temperature of the bottom surface of the substrate is kept at  $T_0 = 30\text{ }^\circ\text{C}$ . The top surface is exposed to a radiative heat flux of  $q'' = 3000\text{ [W/m}^2\text{]}$ , which is fully absorbed at the top surface. In addition, there is convective heat transfer with a fluid at temperature  $T_\infty = 20\text{ }^\circ\text{C}$  and the convective coefficient  $h=40\text{ W/(m}^2\text{K)}$ . Determine the temperature at the interface between the film and the substrate,  $T_1$ . The thickness of the film is  $a = 0.2\text{ mm}$  and the thickness of the substrate is  $b = 1.0\text{ mm}$ . Thermal conductivity of the film  $k_f$  is  $0.02\text{ W/(m.K)}$ , and the thermal conductivity of the substrate  $k_s$  is  $0.06\text{ W/(m.K)}$ . (10 points)

2. For solving a 2-D transient heat conduction problem, a node,  $T_o$ , is placed on the corner as shown in the figure below. There is a uniform internal heat generation in the solid, with a volumetric heat generation rate  $q'''$  [ $\text{W/m}^3$ ]. The right surface is exposed to a flowing fluid at temperature  $T_\infty$  and convective coefficient is  $h$ . The bottom surface is thermally insulated. Using the first law of thermodynamics, derive a nodal equation for  $T_o$  in an explicit scheme in terms of the temperature of surrounding nodes,  $h$ ,  $T_\infty$  and  $q'''$ , as well as the properties of the solid,  $k$ ,  $\rho$ , and  $C$ . Determine the stability criterion for this scheme. Assume  $\Delta x = \Delta y$ , and the unit depth. (10 points)

3. Consider the metal link on a fire sprinkler head. It is a rectangular parallelepiped of thickness  $L$ , length  $a$  and width  $a$ . Assume and then justify that it can be treated as a lumped system. If the link, at an initial temperature,  $T_i = 20^\circ\text{C}$ , is suddenly exposed to the fire gas at  $T_\infty = 300^\circ\text{C}$ , with a constant convective heat transfer coefficient,  $h = 30\text{ W}/(\text{m}^2\text{K})$ , how long will it take for the link to reach  $297^\circ\text{C}$ . Neglect radiation. The thermal conductivity of the metal link  $k = 400\text{ W}/(\text{m}\cdot\text{K})$ .  $L = 2\text{ cm}$ ,  $a = 0.6\text{ m}$ .  $\rho C = 3 \times 10^6\text{ J}/\text{m}^3\cdot\text{K}$ . (10 points)
