

**CS 170, Spring 1994**  
**Final Examination**  
**Professor Manuel Blum**

---

This is a CLOSED BOOK exam.

Calculators ARE permitted.

Do at least 4 of the following 5 problems.

If you do all 5, your grade will be the sum of your best 4 grades.

Try to do all 5 problems.

PUT ALL YOUR ANSWERS IN YOUR BLUE BOOK.

---

**Problem #1a (5 pts)**

Is  $n^{\log_2 n} = 2^{\log_2^2 n}$ ? If not, is it  $<$  or  $>$ ?

**Problem #1b (5 pts)**

(i) Find a MAX FLOW in this network:

(ii) Find a min cut in the above network.

**Problem #1c (5 pts)**

You are given a fair coin. How would you use it to simulate a toss of a (6-sided) die?

### Problem #1d (5 pts)

Give an algorithm to multiply 2 complex numbers  $a+ib$  and  $c+id$  using just 3 real multiplications.

INPUT: 4 real numbers  $a, b$  and  $c, d$  (denoting  $a+ib$  and  $c+id$ )

OUTPUT:  $ac-bd, ad+bc$  (denoting  $(ac-bd) + i(ad+bc)$ )

---

### Problem #2a (10 pts)

Give an efficient algorithm to determine whether 2 given points  $P_1 = (x_1, y_1)$  and  $P_2 = (x_2, y_2)$  lie on the same side of a given line,  $y = ax+b$ . Here  $a, b$  are rational numbers.

### Problem #2b (10 pts)

Give an algorithm to find the minimum of  $n$  integers  $[a_1 \dots a_n]$  in  $O(1)$  steps on a CRCW parallel computer.

---

### Problem #3 (20 pts)

How many exchanges  $\langle i, j \rangle$  are necessary and sufficient to sort  $n$  keys  $[a_1 \dots a_n]$ ? The operation  $\langle i, j \rangle$  exchanges  $a_i$  with  $a_j$ .

HINT: Draw a digraph to represent the desired outcome.

EXAMPLE:  $[3, 1, 4, 2]$

3 exchanges are sufficient.

**Problem #4**

Polynomial Zero-Finding (PZF) is defined as follows:

INSTANCE: A multi-variable polynomial  $P(x,y,z,\dots)$  with integer coefficients (Example:  $3xy^2 - 5x^2z + 7$ )

QUESTION: Does the given polynomial have a real root?

i.e. Does  $P(x,y,z,\dots) = 0$  for (some) any real numbers

$x,y,z,\dots$ ? (In above example, answer is YES:  $x = -7/3$ ;

$y = 1$ ;  $z = 0$ )

The purpose of this problem is to show that  $\text{SAT}(\text{proportional symbol})\text{PZF}$  (whence PZF is NP-hard).

**Problem #4a (1 pt)**

A Karp reduction for  $\text{SAT}(\text{proportional symbol})\text{PZF}$  requires a function

$f$ : INSTANCE of \_\_\_\_\_  $\rightarrow$  INSTANCES of \_\_\_\_\_. (Fill in the blanks.)

**Problem #4b (1 pt)**

What 3 properties must any such  $f$  have?

**Problem #4c (8 pts)**

The following function (described here by example) almost but doesn't quite work:

$f$ :  $(x + y(\text{complex conjugate notation})) (z + y) (z(\text{complex conjugate notation})) \rightarrow x(1-y) + zy + (1-z)$

Which of the 3 properties does it have, and which not? Give solid (i.e. correct) reasons for your answers.

**Problem #4d (10 pts)**

Give a function  $f$  that works (i.e. has all 3 properties) and prove that it works.

---

**Problem #5 (DYNAMIC PROGRAMMING)**

The following problem arises in a video compression scheme:

**INPUT:**  $n$  real numbers  $a_1 < \dots < a_n$  and a positive integer  $k < n$ .

**OUTPUT:**  $k$  points (real numbers)  $x_1 < \dots < x_k$  and a function

$f: \{1, 2, \dots, n\} \rightarrow \{1, \dots, k\}$  that minimizes **summation symbol with terms on top and bottom**  $([a_i - x_{f(i)}]^2)$ .

**Problem #5a (4 points)**

Solve the above problem for  $k=1$ . **CHECK:** If input =  $[2,4,6,10]$  and  $k=1$ , then optimal choice of  $x_1$  is 5.5 and **summation symbol** $[a_i - x_1]^2 = \underline{\hspace{2cm}}$ .

**Problem #5b (4 points)**

Give an efficient algorithm to solve the above problem for  $k = 2$ .

**CHECK:** If input =  $[2,4,6,10]$  and  $k=2$ , then  $x_1=4$ ,  $x_2=10$ , and **summation symbol** $[a_i - x_{f(i)}]^2 = \underline{\hspace{2cm}}$ .

**Problem #5c (4 points)**

Suppose you are given a table  $T_{k-1}$  in which every cell  $(r,c)$

(row =  $r$ , column =  $c$ ) contains the optimal value

$\min\{\text{summation symbol with terms on top and bottom}[a_i - x_{f(i)}]^2\}$  for input  $\leftarrow$  cell( $r,c$ )

$[a_c \dots a_{r+c}]$  using  $k-1$  points  $x_1, \dots, x_{k-1}$ .

		COLUMN						
ROW	0	1	2	3	4	5	...	$n$
		$a_1$	$a_2$	$a_3$	$a_4$	$a_5$	...	$a_n$
1								
2								
3								
4								

How would you use  $T_{k-1}$  to fill  $T_k$ ?

Do this for the case  $[2,4,6,10]$  by filling in the empty cells in the following tables:

k=1

2	4	6	10
2			
	18.66		

k=2

2	4	6	10
0			
	2		

k=3

2	4	6	10
0			
	0		

**Problem #5d (4 points)**

Give an algorithm to fill a sequence of  $n-1$  tables, for  $k=1, 2, \dots, n-1$ .  
Your algorithm should show how to use the tables for  $1, \dots, k-1$  to fill the table for  $k$ .

(The difference between parts c and d is that c just requires you to fill the above tables, while d requires you to write out the algorithm.)

The entry in cell (r,c) of table k should contain

minimum { **summation symbol with terms on top and bottom**  $[a_i - x_{f(i)}]^2$  } where the min is over all sets of  $k$  points:  $x_1, \dots, x_k$

& functions  $f: \{1, \dots, n\} \rightarrow \{1, \dots, k\}$

**Problem #5e (4 points)**

How many "steps" does your algorithm take?
