TOTAL EXAM SCORE (100)

Rules:

- No lecture notes or books permitted
- No word processing calculators
- Time: 50 minutes
- Show all work to get partial credit
- Periodic Table, Tables of Physical Constants, Conversion Factors included

$312 + 563 - 491 - 413 = 57 = \text{kJ/mol}$

(3)  
 10

(3)  
 15

1. (5+5+5 points) Use the data from Octoby Table 7.3 copied below, together with your knowledge of thermodynamics to answer the following:

Average Bond Enthalpies

	Molar Enthalpy of Atomization (kJ mol <sup>-1</sup> ) <sup>a</sup>	Bond Enthalpy (kJ mol <sup>-1</sup> ) <sup>b</sup>									
		H—	C—	C=C	C≡C	N—	N=N	N≡N	O—	O=	
H	218.0	418	413			391			463		
C	716.7	413	348	612	812	392	413	891	531	738	
N	472.7	391	292	612	891	161	413	941			
O	249.2	463	311	719					139	498	
S	278.8	329	219	477							
F	391.0	561	441			278			185		
Cl	121.7	432	318			209			205		
Br	111.0	368	276								
I	106.8	299	248								

Estimate the average bond enthalpy for the C-Cl bond in the solid.

a) Calculate the bond enthalpy for the Cl-Cl bond in Cl<sub>2(g)</sub>, which is the standard state for chlorine.

$$121.7 \text{ kJ/mol}$$

to atomize Cl<sub>2</sub>

b) A suggested reaction for the removal of <sup>•</sup>CF<sub>3</sub> radicals in the atmosphere is:

Calculate  $\Delta H$  for this reaction. Is it exothermic or endothermic?

$$+ (\text{C-H})_{\text{reactants}} \rightarrow 563$$

- Products + reactants

$$(\text{C-C}) + (\text{H-F}) - (\text{C-F}) - (\text{C-H})$$

$$348 \quad 563 \quad 441 \quad 413 = 57 = \text{end} = \text{endothermic}$$

3/5

c) The standard state of sulfur is a solid consisting of  $S_8$  molecules with the sulfur atoms joined in an 8-membered ring.

Estimate the average S-S bond enthalpy. (You may ignore the weak intermolecular interactions in the solid.)

$278.8 \text{ kJ/mol} = \Delta H_{\text{atomization}}$

As the normal boiling point of water,

$\frac{278.8 \text{ kJ/mol}}{8 \text{ bonds/mol}} = 34.85 \text{ kJ/bond}$

Assuming ideal gas behavior:

a) Calculate  $\Delta G^\circ_{\text{vap}}$  and  $\Delta H^\circ_{\text{vap}}$  for converting 1 mole of liquid water to vapor at 373K

$\Delta G^\circ_{\text{vap}} = \Delta H^\circ_{\text{vap}} - T\Delta S^\circ_{\text{vap}}$   
 $0 = 4066 \text{ J/mol} - (373 \text{ K}) \Delta S^\circ_{\text{vap}}$   
 $\Delta S^\circ_{\text{vap}} = \frac{4066 \text{ J/mol}}{373 \text{ K}} = 10.9 \text{ J/mol}\cdot\text{K}$   
 $\Delta G^\circ_{\text{vap}} = 4066 \text{ J/mol} - (373 \text{ K})(10.9 \text{ J/mol}\cdot\text{K}) = 0$

b) calculate the equilibrium vapor pressure of water at 298K.

c) Calculate  $\Delta G^\circ_{\text{rxn}}$  for water at 298K.

$H_2O(l) \rightarrow H_2O(g)$   
 $\Delta G^\circ_{\text{rxn}} = \Delta G^\circ_{\text{f}}(H_2O(g)) - \Delta G^\circ_{\text{f}}(H_2O(l))$   
 $= -228.57 \text{ kJ/mol} - (-237.13 \text{ kJ/mol}) = 8.56 \text{ kJ/mol}$

(9)

(5)

2. (5+5+5 points)

$$R = 8.3 \text{ J K}^{-1} \text{ mol}^{-1} = 0.082 \text{ L-atm-K}^{-1} \text{ mol}^{-1}$$

Data for  $\text{H}_2\text{O}$  at 298K

	$\Delta H_f^\circ$ (kJ/mol <sup>-1</sup> )	$S^\circ$ (J/K <sup>-1</sup> mol <sup>-1</sup> )	$\Delta G_f^\circ$ (kJ/mol <sup>-1</sup> )	$C_p$ (J/K <sup>-1</sup> mol <sup>-1</sup> )
$\text{H}_2\text{O}_{(l)}$	-241.82	188.72	-228.59	35.58
$\text{H}_2\text{O}_{(g)}$	-285.83	69.91	-237.18	75.29

At the normal boiling point of water, 373K,  $\Delta H_{\text{vap}}^\circ$  is 40.66 kJ/mol<sup>-1</sup>.

Assuming ideal gas behavior:

a) Calculate  $\Delta E^\circ$  and  $w$  for converting 1 mole of liquid water to vapor at 373K.

$$\Delta E = q_p + w$$

$$nC_p \Delta T + P \Delta V$$

$$40.66 (+) \frac{30.6 \times 101.325 \text{ J/Latm}}{1000 \text{ J/kJ}}$$

$$43.76 \text{ kJ/mol}$$

$q_p = \Delta H$   
 $V_0 = 0$   
 $V_f = \frac{nRT}{P}$   
 $= 2.27 \times 10^{-2} \text{ m}^3$   
 $30.6 \text{ L}$

(3/5)

b) calculate the equilibrium vapor pressure of water at 298K.

~~$$44.01 \text{ kJ/mol}$$~~

0/5

c) Calculate  $\Delta H_{\text{vap}}^\circ$  for water at 298K

$$H_{\text{prod}} - H_{\text{react}}$$

$$-241.82 - (-285.83) = 44.01 \text{ kJ/mol}$$

(5/5)

3 (25 points) A 60g sample of hydrogen bromide,  $\text{HBr}_{(g)}$ , MW 80.9, at 300K and occupying 50.0L, is first expanded isothermally and reversibly to a volume such that, when it is heated reversibly at constant volume to 500K, the final pressure is the same as the initial pressure. Using  $C_p(\text{HBr}_{(g)}) = 29.1 \text{ JK}^{-1}\text{mol}^{-1}$ , calculate  $\Delta E$ ,  $q$ ,  $w$ ,  $\Delta H$ , and  $\Delta S$  for the entire process beginning to end. Assume HBr is an ideal gas under these conditions.

500

$\Delta E_{\text{tot}} = 0$

$\Delta S$

$\frac{60g \text{ HBr}}{80.9 \text{ g/mol}} = .741$

$\Delta E_{\text{heat}} = q_v = n C_v \Delta T$

, 3.6 atm -

$q = n C_v \Delta T + (w)$   $.7407 (29.1 - 8.3145) (200 \text{ K})$

$P \Delta V = n R T \ln \frac{V_2}{V_1} = 3.079 \text{ kJ} =$

$44.41 = P_2$   
 $\Delta V = 39.41$

$967.5 \text{ J}$

$n C_p \Delta T = \Delta H$

$.7407 (29.1 (600 - 300))$

Answers/units:

$\Delta E = 3.079 \text{ kJ} + 5$

$q = 4.046 \text{ kJ} + 5$

$w = .9675 \text{ J} \rightarrow$  no work shown

$\Delta H = 4.316 \text{ kJ} \rightarrow$  no work shown

$\Delta S = 8.042 \text{ J}$

$8.4046$

$\Delta S = \frac{q_{\text{rev}}}{T} + 2$

4) If the same number of moles of  $\text{H}_2\text{SO}_4$  were added to ocean water would  $\text{CaSO}_4$  precipitate? Why? Why not?   
 Yes, because the water would then be supersaturated in the  $\text{SO}_4^{2-}$  ions and be forced to precipitate.   
 Inconsistent

9/15

4. (5+5+5 points) Ocean water at 298K contains 0.01M  $\text{Ca}^{2+}$  and the  $K_{sp}$  for  $\text{CaCO}_3$  dissolution is  $9 \times 10^{-7} \text{ M}^2$ .

a) The ocean is saturated in  $\text{CaCO}_3$ . What is the concentration of  $\text{CO}_3^{2-}$  in the ocean.

$$K_{sp} \text{ CaCO}_3 = [\text{Ca}][\text{CO}_3] = 9 \times 10^{-7}$$

$$[\text{CO}_3^{2-}] = [\text{CaCO}_3] + [\text{CO}_3^{2-}] + [\text{HCO}_3^-] + [\text{H}_2\text{CO}_3]$$

$$.01 \text{ M Ca}^{2+}$$

$$[.01] \text{ M } [\text{CO}_3^{2-}] = 9 \times 10^{-7} \quad (5)$$

$$9 \times 10^{-5} = [\text{CO}_3^{2-}]$$

b) The  $K_{sp}$  for  $\text{CaSO}_4$  is  $2.4 \times 10^{-5} \text{ M}^2$ . How many grams of  $\text{Na}_2\text{SO}_4$  will dissolve in a liter of ocean water.

already has  $\text{Na}^+$  but okay.

$$2.4 \times 10^{-5} = [\text{Ca}][\text{SO}_4]$$

$$[.01]$$

$$2.4 \times 10^{-3} = [\text{SO}_4]^{m/l}$$

times molecular weight  $(\text{Na}_2\text{SO}_4)$

$$.3409 \text{ g Na}_2\text{SO}_4$$

c) If the same number of moles of  $\text{H}_2\text{SO}_4$  were added to ocean water would  $\text{CaSO}_4$  precipitate?

Why? Why not?

yes, because the water would then be supersaturated in the  $\text{SO}_4^{2-}$  ion and be forced to compensate.

INCONSISTENT.

Ø

8/6

5. (3+2+2+8 points)

a) Write expression for the equilibrium constant for the following reactions:

dissolution of  $\text{Ca}(\text{OH})_2$

$$K_{sp} = \frac{[\text{Ca}^{2+}][\text{OH}^-]^2}{[\text{Ca}(\text{OH})_2]}$$

$$K_{sp} \text{ H}_3\text{PO}_4 = \frac{[\text{H}_3\text{O}^+][\text{PO}_4^{3-}]}{[\text{H}_2\text{PO}_4^-]}$$

$$K = \frac{[\text{HemoH}^+][\text{HemoPO}_2][\text{HemoO}_2]}{[\text{Hemo}][\text{H}^+][\text{CO}_2][\text{CO}_3]}$$

b) Which solution is a better buffer? (circle your answer)

0.01M  $\text{NaHCO}_3$  with 0.01 M  $\text{Na}_2\text{CO}_3$  or 0.1M  $\text{NaHCO}_3$  with 0.1M  $\text{Na}_2\text{CO}_3$  +2

c) Which solution is a better buffer? (circle your answer)

0.03M  $\text{NaOH}$  with 0.1 M  $\text{H}_3\text{PO}_4$  or 0.1M  $\text{NaOH}$  with 0.03M  $\text{H}_3\text{PO}_4$  0

d) Sketch a titration curve for a 10ml aliquot of a formic acid buffer 0.01M  $\text{HCOOH}$  with 0.01M  $\text{NaHCOO}$  using 0.01M  $\text{NaOH}$  as the titrant. Label the axes. What is the volume of  $\text{NaOH}$  at the equivalence point?

8/8

6. (8+5+2 points) a) A student dissolves 0.5000 g of an unknown sulfate salt in water and adds excess  $BaCl_2$ . The mixture is digested until all the  $BaSO_4$  present has precipitated out. The precipitate is collected on a Gooch crucible with an initial mass 14.5687 g; when the dry product and crucible are weighed the mass is determined to be 15.1285 g. A calorimetry experiment using the metal of the same unknown cation yields a specific heat capacity of roughly  $0.22 J/g$  °C. What is the molecular weight (to four significant digits) and identity of the unknown metal?

$S_x \cdot Y \cdot SO_4 \rightarrow (14.5687 \text{ g} + 15.1285 \text{ g}) BaSO_4$   
 $\frac{.53}{.4402 \text{ g } BaSO_4} \checkmark$   
 $\frac{.53}{265.047 \text{ g/mol unk}} \quad \frac{.53 \text{ mol } BaSO_4 (233.392)}{2.3985 \times 10^{-3} \text{ g}} \checkmark$   
 $- \frac{.53}{169.03 \text{ g/mol } SO_4} \quad \frac{.53 \text{ mol } SO_4 (112.4016 \text{ g/mol})}{1.9861 \times 10^{-3} \text{ mol } BaSO_4 = \text{Moles of } SO_4}$   
 $\text{Cd}$  8/8

b) If 1.000 g of the metal is placed at the bottom of a beaker of water which is then acidified while trapping the gas produced, what is the equivalent mass of hydrogen gas evolved?

$4.4483 \times 10^{-3} \text{ moles } H_{2(g)}$  9/5

c) If the experiment is carried out in a lab at 1.000 atm and 25 °C, neglecting the vapor pressure of water, will a 25 mL graduated cylinder be large enough to contain the gas produced?

$4.4483 \times 10^{-3} \text{ moles } H_{2(g)} \times 22.4 \text{ L/mol @ STP}$   
 $.09964 \text{ L}$

$\approx 99.6 \text{ mL}$

(NO)
