UC Berkeley Honor Code: "As a member of the UC Berkeley community, I act with honesty, integrity, and respect for others."

On my honor, I have neither given nor received any assistance in the taking of this exam.

## Instructions:

1. Write your full name and Student ID on the question sheet
2. Write your full name on the front of the bubble sheet
3. If your student ID number has 8 digits, start with the left box and bubble then in (leaving the right two boxes blank). If your student ID number has 10 digits, just use all boxes
4. Record your answers on the bubble sheet (use pencil). There is one correct answer for each question. Multiple bubbles, incomplete bubbles, or stray marks will be marked incorrect.
5. You may use one 8.5" by 11" cheat sheet(both sides) for this exam provided you do not disturb those sitting nearby.
6. No electronic devices are permitted in your work area.
7. There will be no questions regarding the exam during the examination time except in cases where there is a missing page or printing problem with your exam.
8. For convenience, you may separate the bubble sheet from the question sheet, return both after the exam.

The function `exppo` below was developed to compute the first  $N$  terms of this series, but is incomplete. When inserted into the incomplete line, which of these options will correctly compute this series?

18. After executing the following code, which of the following is **not true**?

**Note:** `trapz` is a Matlab built-in function.

```
>> help trapz  
trapz Trapezoidal numerical integration.  
Z = trapz(Y) computes an approximation of the integral of Y via  
the trapezoidal method (with unit spacing). To compute the integral  
for spacing different from one, multiply Z by the spacing increment.  
  
For vectors, trapz(Y) is the integral of Y. For matrices, trapz(Y)  
is a row vector with the integral over each column. For N-D  
arrays, trapz(Y) works across the first non-singleton dimension.  
  
Z = trapz(X,Y) computes the integral of Y with respect to X using  
the trapezoidal method. X and Y must be vectors of the same  
length, or X must be a column vector and Y an array whose first  
non-singleton dimension is length(X). trapz operates along this  
dimension.  
  
Z = trapz(X,Y,DIM) or trapz(Y,DIM) integrates across dimension DIM  
of Y. The length of X must be the same as size(Y,DIM).  
Example:  
>> trapz([1,2])  
  
ans =

integral Numerically evaluate integral.
  Q = integral(FUN,A,B) approximates the integral of function FUN from A
  to B using global adaptive quadrature and default error tolerances.

  FUN must be a function handle. A and B can be -Inf or Inf. If both are
  finite, they can be complex. If at least one is complex, integral
  approximates the path integral from A to B over a straight line path.
